1. Introduction

This manual describes the external interface specifications which are applicable when the HD integrated camera is operated using Ethernet.
It consists of three main sections, namely, camera and pan-tilt head control, camera information update notifications and error return.

Applicable models
・AW-HE50 series※, AW-HE120 series, AW-HE60 series, AW-HE130 series
AW-HE40 series, AW-HE65 series, AW-HE70 series
※The functions indicated as “Ver.2” in the text can be used when the activation process has been completed after the upgrade kit (AW-HEF5) is applied.

2. Configuration outline

This manual has the following general configuration.

① Camera and pan-tilt head control
It is possible to control the pan, tilt and white balance adjustments.
It is also possible to acquire the gain and other camera information by initiating queries.
The various functions are employed for the operations with the camera using HTTP which is the host protocol of TCP.
For further details, refer to chapter 3.

② Camera information update notification
The local terminal is notified of the values of the gain and other settings which have been changed at another terminal or other terminals so that it can acquire the camera information.
This feature is useful when one camera is controlled by a multiple number of terminals, and when the setting for enabling update notifications to be received has been established, the information which has been changed by other terminals can be acquired.
For further details, refer to chapter 4.

③ Camera information batch acquisition
The camera information can be acquired in batch form. Since there is no need to query each and every camera information item when this feature is used, the feature is useful when all the camera information is required such as at startup.
For further details, refer to chapter 5.

④ Error return
An error — whether ER1, ER2 or ER3 — is returned when an error has been generated by a command in ① above or when the AWB result contains an error.
For further details, refer to chapter 6.

3. Camera and pan-tilt head control

Given below are the external interfaces which are used when operating the camera using Ethernet. This chapter presents the following details.

① Pan-tilt head control
This interface controls the pan-tilt head, and it uses the “pan-tilt head control commands”.

② Camera control
This interface is concerned with the camera’s lens control and image adjustments, and it uses the “camera control commands”.

3.1. Pan-tilt head control

The pan-tilt head control commands are in compliance with the HTTP1.1 communication specifications. Their format is given below.
For details on the HTTP messages, refer to <Appendix>.

【Command format】

[Send]
http://[**IP Address**]/cgi-bin/aw_ptz?cmd=[**Command**]&res=[**Type**]
where
※IP Address…… IP address of camera at connection destination
※Command…… Details given in “Command” column in the command tables below
※Type…… Fixed at “1”

[Receive]
200 OK “**Command**”
※Command…… Response value of each command; set in the HTTP message body

Example: Pan/tilt (Stop)

[Send]
http://192.168.0.10/cgi-bin/aw_ptz?cmd=#PTS5050&res=1

[Receive]
200 OK **“pTS5050”**

※Depending on the browser or middleware used, “**#**” may have to be converted to “%23” by ASCII conversion.
http://192.168.0.10/cgi-bin/aw_ptz?cmd=%23PTS5050&res=1

Given below is the communication sequence which accords with the command format presented on the previous page.
For the communication sequence of the errors generated in response to commands which have been sent, refer to “6. Error return”.

【Sequence】

“PC1” is the control terminal in the sequence below.

Example: Pan/tilt (Stop) control
Camera IP Address = 192.168.0.10
Command = PTS5050

The control to stop the pan-tilt operation is exercised from PC1. [200 OK “pTS5050”] is returned as the response from the camera.
The control command and query command are available as the pan-tilt head control commands. Given below is the command sequence.

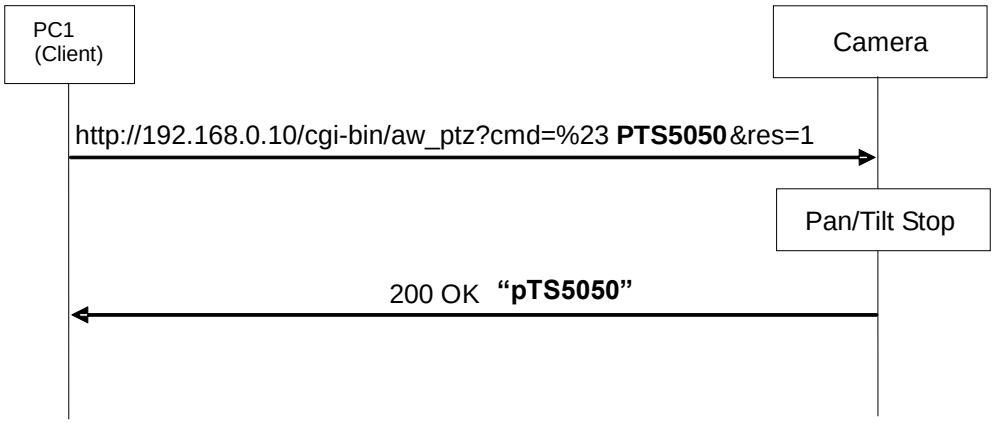

Fig.3.1-1 Command sequence of pan-tilt head control

It must be borne in mind that communication with the camera is subject to some restrictions.
These restrictions are as follows.

【Restrictions】

1. When using the pan-tilt head control commands, send the commands with a gap of 130 ms between each command. Given below is the sequence.

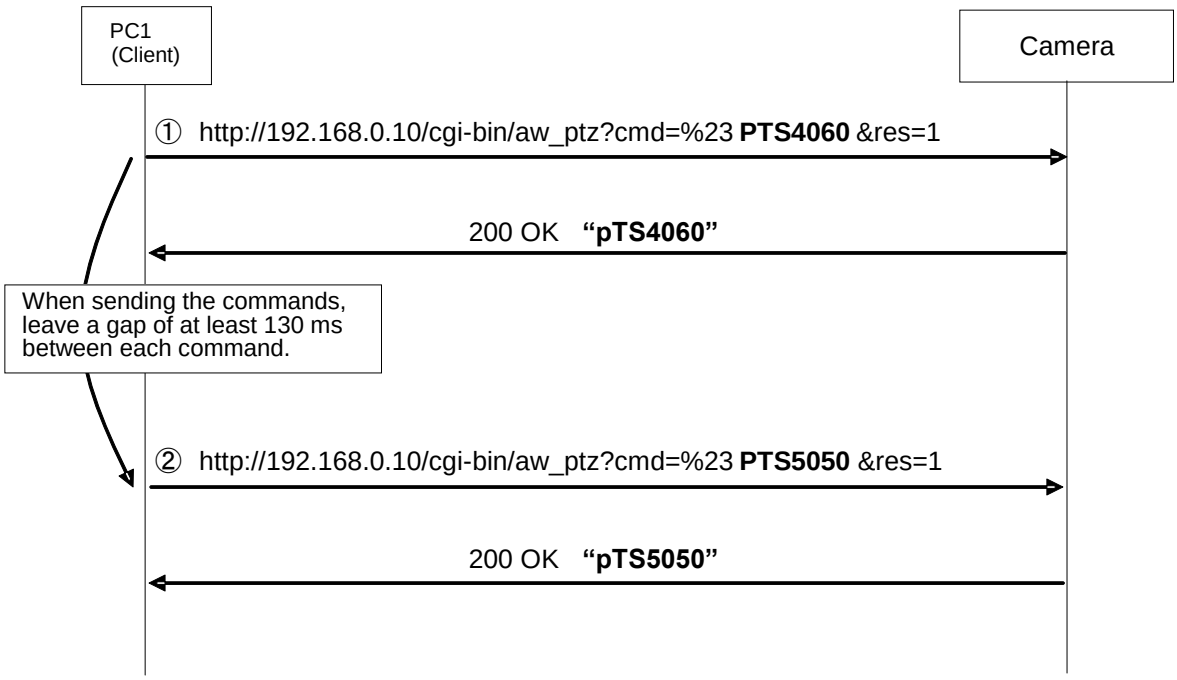

Fig.3.1-2 Restrictions

2. The number of sessions during which the camera can be accessed simultaneously is as follows.
   a) Maximum number of HTTP sessions: 72
   b) Number of terminals which can receive update notifications at the same time: 5
      When the AW-RP50 is connected, it is counted as one unit.

3. Keep-Alive cannot be set with HTTP connections.
   Connect and disconnect are performed each time a command is sent or received.

4. Some settings and conditions may restrict the effects of other settings (※including those with exclusive control conditions). See also the operating instructions which are provided with the products.

5. Send the commands which change the settings only at the point in time when the changes are required. (Do not send them at regular intervals.)
   ※ The applicable models incorporate an EEPROM for storing the settings, and each time a command that changes the settings is received, data is written in the EEPROM. The number of times data can be written in the EEPROM is limited so if data is sent frequently, the model will cease to operate normally when the maximum number of times for writing the data has been reached.

3.1.1. Power On/Standby

These commands enable the power On/Standby of the camera to be controlled and the current power On/Standby statuses to be acquired.

Table 3.1.1. Power On/Standby

Command name	Category	Command	Data value	Setting	Remarks
Power On/ Standby control command	Control	#O[*Data*]	0 f 1 n	Standby Standby Power On Power On

3.1.5.2. Focus

These commands control the focusing (between Near and Far) of the camera and enable the current focus position and focus adjustment speed to be acquired.
They also enable On/Off for the auto focus to be controlled and the current auto focus On/Off status to be acquired.
Commands which control the focusing are also described in section “3.2.1.1. Focus” of “3.2. Camera control”.

3.1.5.3. Iris

These commands control the iris (between Close and Open) of the camera and enable the current iris position to be acquired.
In addition, they enable Auto/Manual control of the iris and the current iris Auto/Manual statuses to be acquired.
Commands which control the iris are also described in section “3.2.1.2. Iris” of “3.2. Camera control”.

3.1.8. Tally

These commands exercise enable/disable control over the tally input of the camera and enable the current tally input enable/disable statuses to be acquired.
In addition, they exercise tally On/Off control over the camera.

Table 3.1.8. Tally

Command name	Category	Command	Data value	Setting	Remarks
Tally input enable/disable control command	Control	#TAE[*Data*]	0 1	Disable Enable

3.1.10. Zoom position-linked pan/tilt speed adjustment On/Off

These commands exercise On/Off control over the zoom position-linked pan/tilt speed adjustments of the camera and enable the current On/Off statuses to be acquired.
When the lens is zoomed toward Tele, the pan/tilt movement is set to the low speed.

Table 3.1.10. Zoom position-linked pan/tilt speed adjustment On/Off

3.2. Camera control

The camera control commands are based on the HTTP1.1 communication specifications.
Their format is given below. For details on the HTTP messages, refer to <Appendix>.

【Command format】

[Send]

http://[IP Address]/cgi-bin/aw_cam?cmd=[Command]&res=[Type]

※**IP Address**…… IP address of camera at connection destination
※**Command**…… Details given in “Command” column in the command tables below
※**Type**…… Normally “1” (but “0” for the AWB[OWS] and ABB[OAS] commands)

[Receive]

200 OK “**Command**”
※**Command**…… Response value of each command; described in the HTTP message body.

There is no response in the case of an AWB or ABB command whose Type is 0.
Refer to “4. Camera information update notification” in order to receive the AWB/ABB result notifications.

Example: Focus setting = Auto

[Send]

http://192.168.0.10/cgi-bin/aw_cam?cmd=OAF:0&res=1

[Receive] The response is the HTTP response.

200 OK **“OAF:0”**

Given below is the sequence used when communication has been performed in accordance with the command format described on the previous page.
For the sequence when errors have been generated in response to commands, refer to “6. Error return”.

【Sequence】
“PC1” is the control terminal in the sequence below.
Example: Focus setting = Auto
Camera IP Address = 192.168.0.10
Command = OAF:1

Auto focus control is performed from PC1, and [200 OK “OAF:1”] is returned as the response.
Both a control command and query command are available as the camera control commands.
Given below is the command sequence.

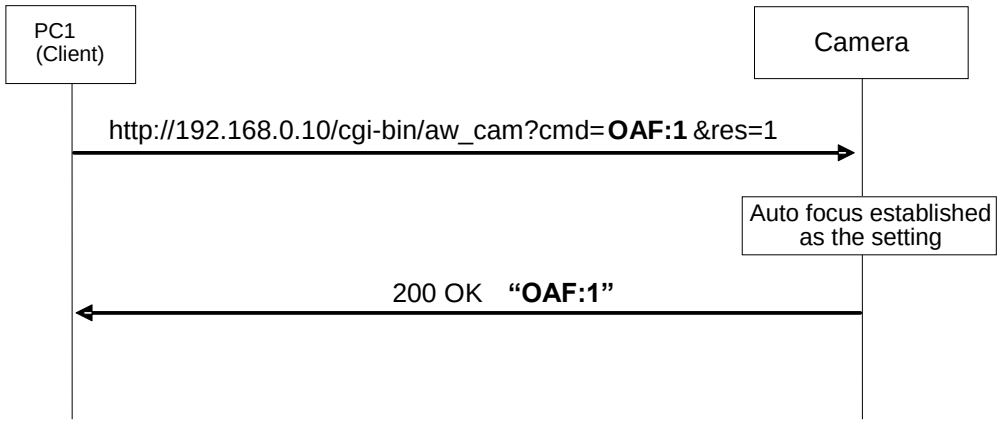

Fig.3.2-1 Camera control command sequence

The following restrictions should be noted when using these commands.
These restrictions are as follows.

【Restrictions】

1. When sending the camera control commands, send the commands with a gap of 130 ms between each command.
   Given below is the command sequence.

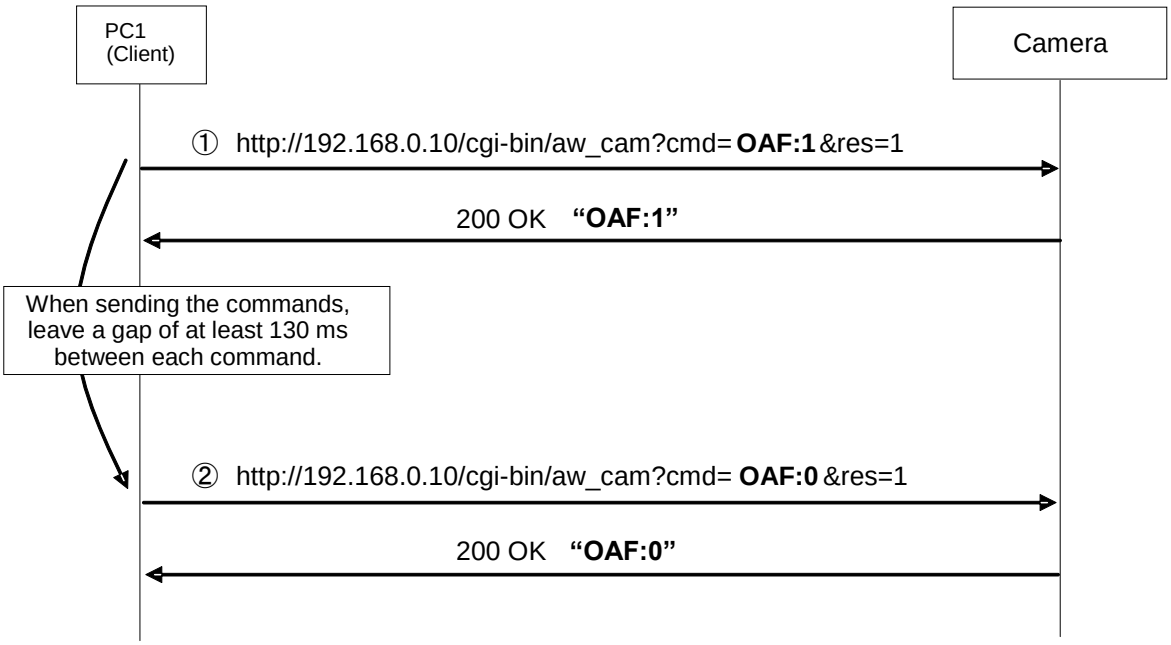

Fig.3.2-2 Restrictions

2. Send the commands which change the settings only at the point in time when the changes are required. (Do not send them at regular intervals.)
   ※The applicable models incorporate an EEPROM for storing the settings, and each time a command that changes the settings is received, data is written in the EEPROM. The number of times data can be written in the EEPROM is limited so if data is sent frequently, the model will cease to operate normally when the maximum number of times for writing the data has been reached.

3.2.1. Lens operations

3.2.1.1. Focus

These commands exercise Auto/Manual control of the focusing and one-touch auto focus control of the camera.
Commands which control the focusing are also described in section “3.1.5.2. Focus” of “3.1. Pan-tilt head control”.

Table 3.2.1.1. Focus

Command name	Category	Command	Data value	Setting	Remarks
Focus Auto/Manual control command	Control	OAF:[*Data*]	0 1	Manual Auto	• In case of AW-HE130, focus cannot be set to Auto when FrameMix is set to 18 [dB] or higher.
	Response	OAF:[*Data*]			
Focus Auto/Manual query command	Request	QAF	None		
	Response	OAF:[*Data*]	0 1	Manual Auto	
One-touch focus control command	Control	OSE:69:[*Data*]	1	One Touch AF	One-touch focus On control
	Response	OSE:69:1			

Example of use)

[Response] AW-HE50 → PC
200 OK “OSE:69:1”

3.2.1.2. Iris

These commands control the iris (between Close and Open) of the camera and enable the current iris position to be acquired.
They also enable iris Auto/Manual to be controlled, the iris Auto/Manual status to be checked and the 10 steps of the contrast level (AW-HE50/AW-HE60/AW-HE40/AW-HE65/AW-HE70), the 20 steps of the picture level (AW-HE120) or the 100 steps of the picture level (AW-HE130) to be set and these settings to be checked.
Commands which control the iris are also described in section “3.1.5.3. Iris” of “3.1. Pan-tilt head control”.

Table 3.2.1.2. Iris

4. Camera information update notification

The following restrictions apply to camera operations that are performed using HTTP communication and that have been described in the previous chapters:

A) Even when a camera setting is changed by one terminal, the other terminals will not know that the setting has been changed unless they send the query command to the camera.

B) In the case of a preset playback, AWB/ABB execution or other control commands that take time to be processed, it is necessary to wait until the processing is completed for the response.

By sending information autonomously from the camera to the terminals, it is possible to do the following:

A) When a camera setting is changed by one terminal, the other terminals are notified of the setting change immediately.

B) With a control command that takes time to be processed, the HTTP response is returned as soon as the command has been received, and separate notification of the processing result is given as soon as the processing is completed.

These functions are referred to as the camera information update notification function.
This chapter uses the term “update notification” to refer to this function.

4.1. Procedure for receiving the update notifications

An HTTP message is sent to the camera to start or stop the reception of the update notification from the camera.
At a time like this, the number of the TCP port on the terminal for receiving the update notification (having the update notification sent) is specified.

The ① update notification receive start steps and ② update notification receive end steps are each described below.

① Update notification receive start step

Example)

When reception is to be started with “192.168.0.10” used as the IP address of the camera

http://192.168.0.10/cgi-bin/event?connect=start&my_port=31004&uid=0

※my_port … Number of the TCP port on the terminal (fixed at 31004)

Given below is the sequence which is followed when receiving the update notifications is started.

【Update notification receive start sequence】

The update notification receive start command is sent from the terminal where the update notifications are to be received.
“204 No Content” is returned from the camera which has received the command.

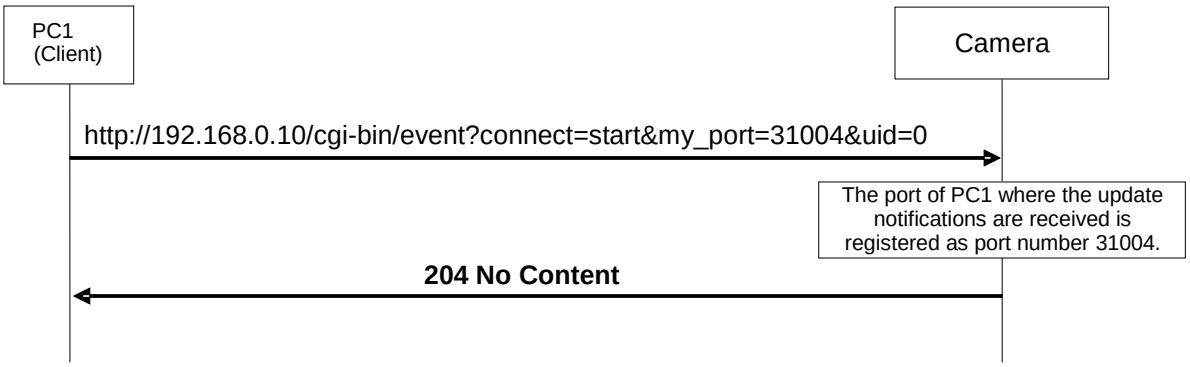

Fig.4-1 Update notification receive start sequence

【Caution】

Proceed with the update notification receive start step when communication has been cut off because the LAN cable has been disconnected, for example.

② Update notification receive end step

To close the application of the client, the update notification receive end step must be taken without fail.

Example)

When reception is to be ended with “192.168.0.10” used as the IP address of the camera

http://192.168.0.10/cgi-bin/event?connect=stop&my_port=31004&uid=0

※my_port … Number of the TCP port on the terminal (fixed at 31004)

Given below is the sequence which is followed when receiving the update notifications is to be ended.

【Update notification receive end sequence】

The update notification receive end command is sent from the terminal which has received the update notifications.

“204 No Content” is returned from the camera which received the command.

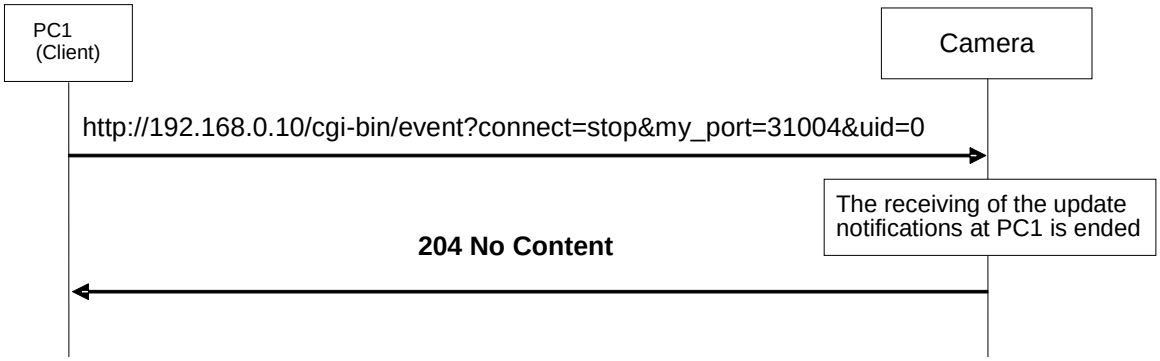

Fig.4-2 Update notification receive end sequence

4.2. Data format for update notifications

The data received in the update notifications will be described next.
The update notification is given to the TCP port on the terminal whose number was specified using the update notification start command by TCP protocol communication.
A breakdown of the data received is given below.

【Receive data】

Reserve (22 bytes)	**Size (2 bytes)**	Reserve (4 bytes)	**Update notification information (Variable length: Max. 504 bytes)**	Reserve (24 bytes)

Fig.4-3 Receive data format

The updated information is set in “Update notification information” of the receive data format.
The data received from the camera has a variable length.
The size of the update notification information is the value obtained by subtracting 8 bytes from the “Size” area setting.

・“Update notification information” data length ＝ “Size” － 8 bytes

The updates of the camera are described in the update notification information.
The format used for the update notification information received from the camera is given below.

【Update notification information format】

[CR][LF][Command response format][CR][LF]

※[CR]:0x0d, [LF]:0x0a

Example 1) Power: On
[CR][LF]**p1**[CR][LF]

Example 2) Color bar: On
[CR][LF]**DCB:1**[CR][LF]

4.3. Setting change sequence

Update notifications are sent when the settings or statuses of the camera have been changed.
Given below is an example of the update notification sequence.
It is assumed that the update notification start command has been sent to all the terminals in the sequence and that the terminals can receive the update notifications from the camera.

4.3.1. Changing the settings from a terminal

【Changing the settings from the local terminal】

When the settings of the camera have been changed from the local terminal (PC1), the changes are also posted by an update notification separately from the HTTP response to the command.

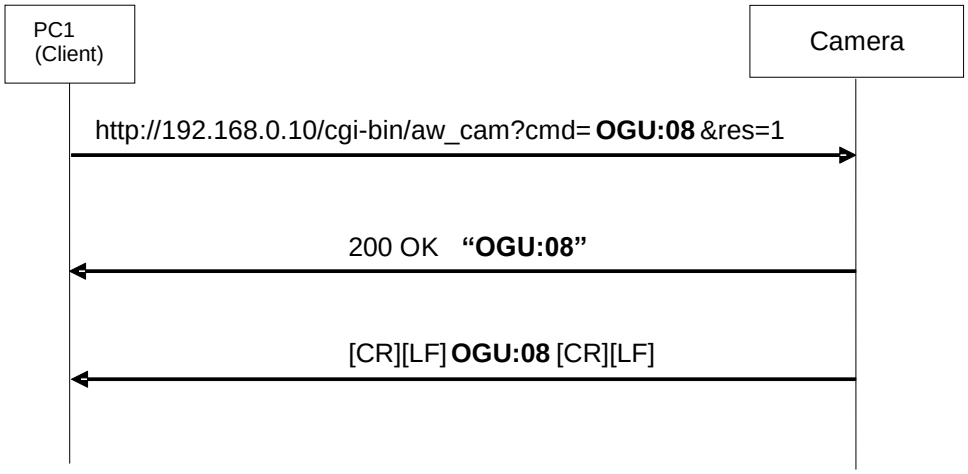

Fig.4-4 Changing the settings from the local terminal

【Changing the settings from another terminal】

When a camera setting has been changed from another terminal (PC2), the local terminal (PC1) is also notified of the change.

In addition to the HTTP response to the command, the other terminal (PC2) is notified of the change by an update notification as well.

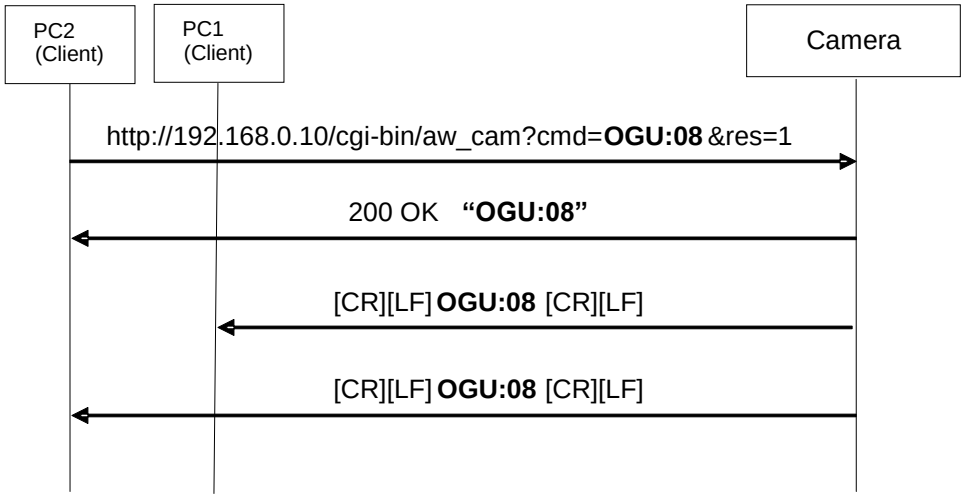

Fig.4-5 Changing the settings from another terminal

(Remarks)
When the camera receives the control command and its setting is changed, it gives an update notification.
(It does not give an update notification if a query command has been received.)
However, when any of the following commands have been received, the update notification is not given.

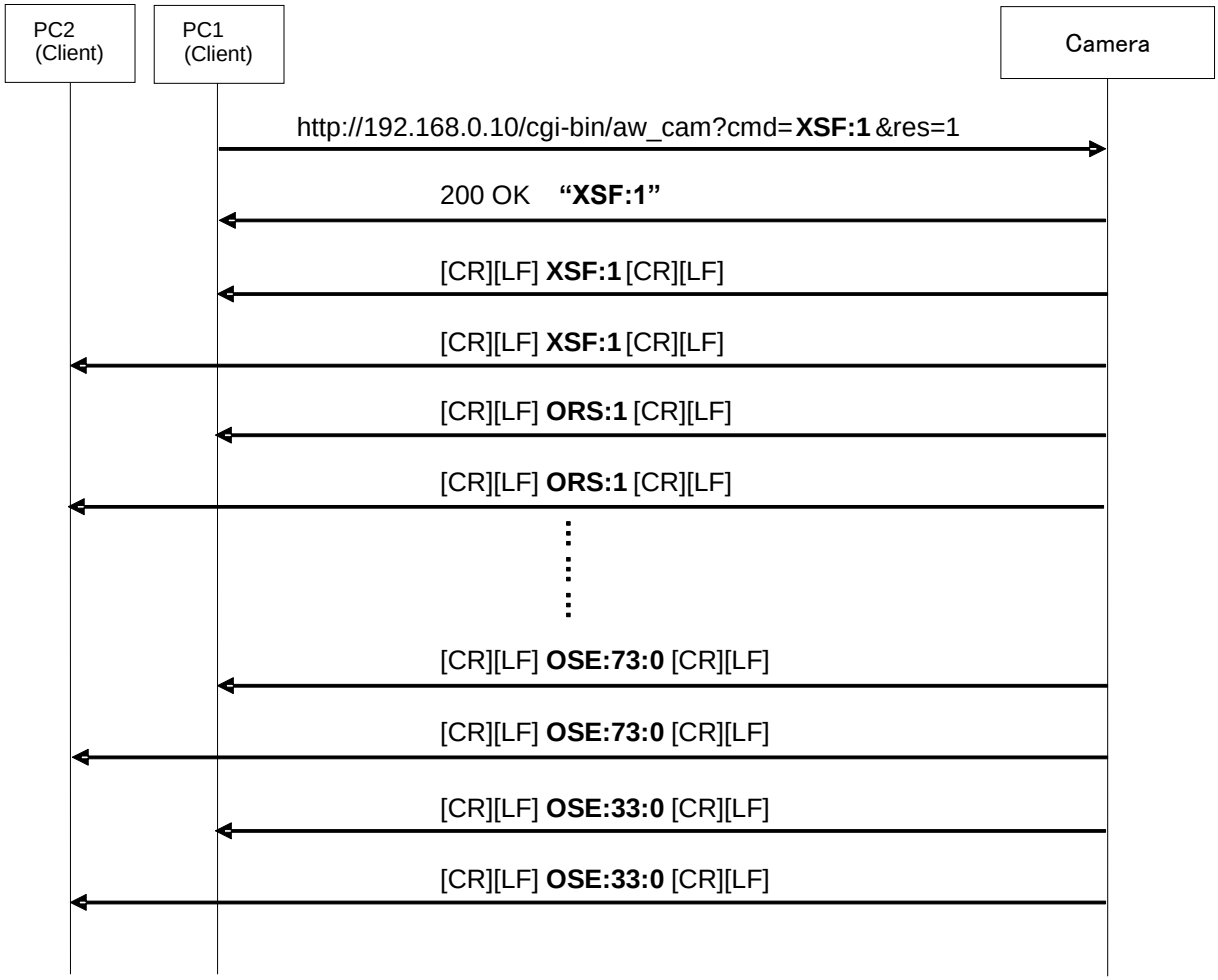
Given below is the sequence which is followed when scene files are selected.

【Scene file selection sequence】

The sequence below is followed if the scene file is changed to “Manual1”.

When “XSF:1” is returned in the response to the scene selection command and the scene file change is completed, the settings changed by the change in the scene file are posted in sequence by update notifications.



※The backlight compensation response (OSE:73:[Data]) is not supported by the AW-HE120.

Fig.4-7 Scene file selection

Described below are sequences which differ from the ones described in the previous pages.

4.4. Special sequences

Update notifications are sometimes sent at times other than when the settings or statuses of the camera have been changed.

Some cases are presented below.

It is assumed that the update notification start command has been sent to all the terminals in the sequence and that the terminals can receive the update notifications from the camera.

4.4.1. Version information notification

The version information is posted in 60-second cycles.

The information posted is given below.

Table 4-6

Notification	Version information
qSV3V∗∗.∗∗∗∗∗∗	qSV3V01.00L.002

Given below is the sequence which is followed when the version information is received.

【Sequence when the version information is received】

The camera sends the version information in 60-second cycles, and this information is received by terminals PC1 and PC2.

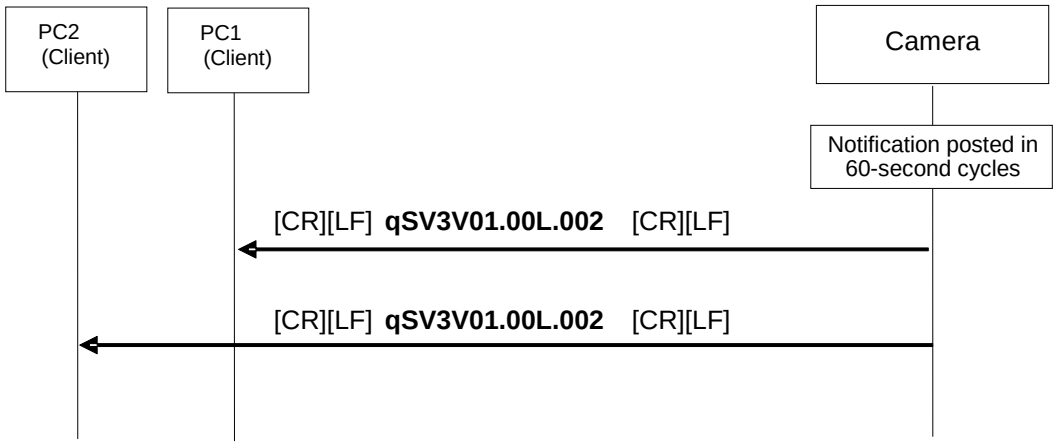


Fig.4-8 Sequence when the version information is received

4.4.2. Error information

In cases where the camera has detected error information, the error information is posted in 30-second cycles.

When operation has been restored from an error condition, [Error Code 00:Normal] is posted only once.

If the error has not been detected, the error information is not posted.

Given below is the information which is posted.

Table 4-7

Notification	Error Code

Given below is the sequence which is followed when error information is received.

【Error information receive sequence】

When the camera detects an error, it sends the error information to the terminals, and terminals PC1 and PC2 receive this information.

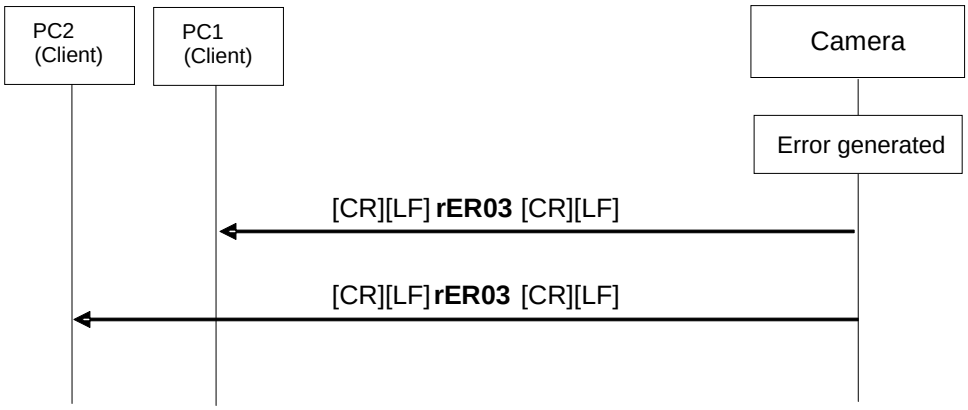

Fig.4-9 Sequence when error information is received

4.4.3. LPI information (lens information)

Notification is sent in a 300ms cycle when “On: Information is posted” has been set for the lens information notification On/Off control command in “3.1.6. Lens information notification” and a change has been made in the LPI information (lens information). The information posted is given below.

Table 4-8

Notification	Lens information
IPI [ZZZ] [FFF] [III]	ZZZ ……Zoom position FFF ……Focus position III ……Iris position

Given below is the sequence which is followed when changes in the LPI (lens) information are received.

【Sequence when LPI information (lens information) is changed】

When the camera detects changes in the LPI (lens) information, the changed LPI (lens) information is sent to the terminals, and terminals PC1 and PC2 receive this information.

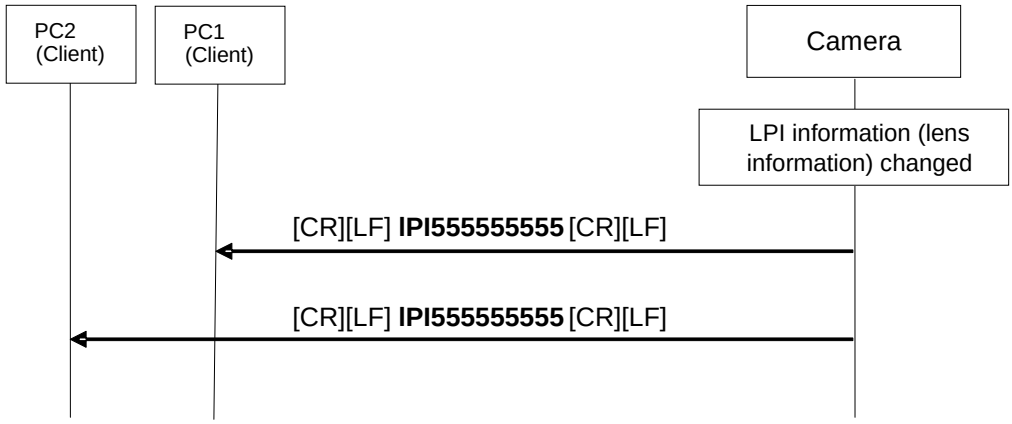

Fig.4-10 Sequence when LPI information is changed

4.4.4. Preset playback

This command sends the preset playback completion notification as an update notification when preset playback in the camera has been completed. The table below gives the notification details.

Table 4-9

Notification	Remarks
q[numeral]	Number of the preset which was played back

Given below is the sequence which is followed when presets are played back.

【Preset playback sequence】

This is the sequence in which preset number 08 is played back.

As soon as the preset playback command is received, “s07” is returned as the HTTP response, and as soon as the playback is completed after this, “q07” is posted separately as the update notification.

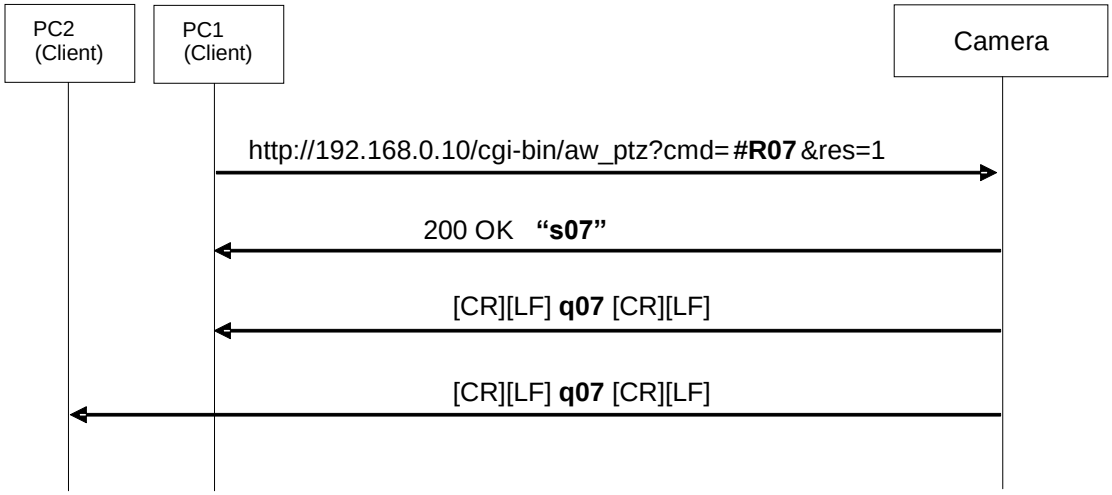

Fig.4-11 Preset playback

4.4.5. AWB/ABB execution

This command sends the execution results as an update notification when execution of AWB/ABB has been completed by the camera.
The information posted is given below.

Table 4-10 AWB result

Notification	Remarks
OWS	AWB execution successful
ORI:096	R Gain (only when AWB is successfully executed) ※1 * Notified with the AW-HE120/AW-HE130
OBI:096	B Gain (only when AWB is successfully executed) ※1 * Notified with the AW-HE120/AW-HE130
ORG:1E	R Gain (only when AWB is successfully executed) ※1 * Notified by AW-HE50 Ver.2 or subsequent versions or by AW-HE60.
OBG:1E	B Gain (only when AWB is successfully executed) ※1 * Notified by AW-HE50 Ver.2 or subsequent versions or by AW-HE60.
ER3:OWS	AWB execution failed

※1: The R gain and B gain update notifications are supported by Ver.2 or a later version for the AW-HE50.

Table 4-11 ABB result

Notification	Remarks
OAS	ABB execution successful
ORP:096	R Pedestal (only when ABB is successfully executed) ※2
OBP:096	B Pedestal (only when ABB is successfully executed) ※2
ER3:OAS	ABB execution failed ※2

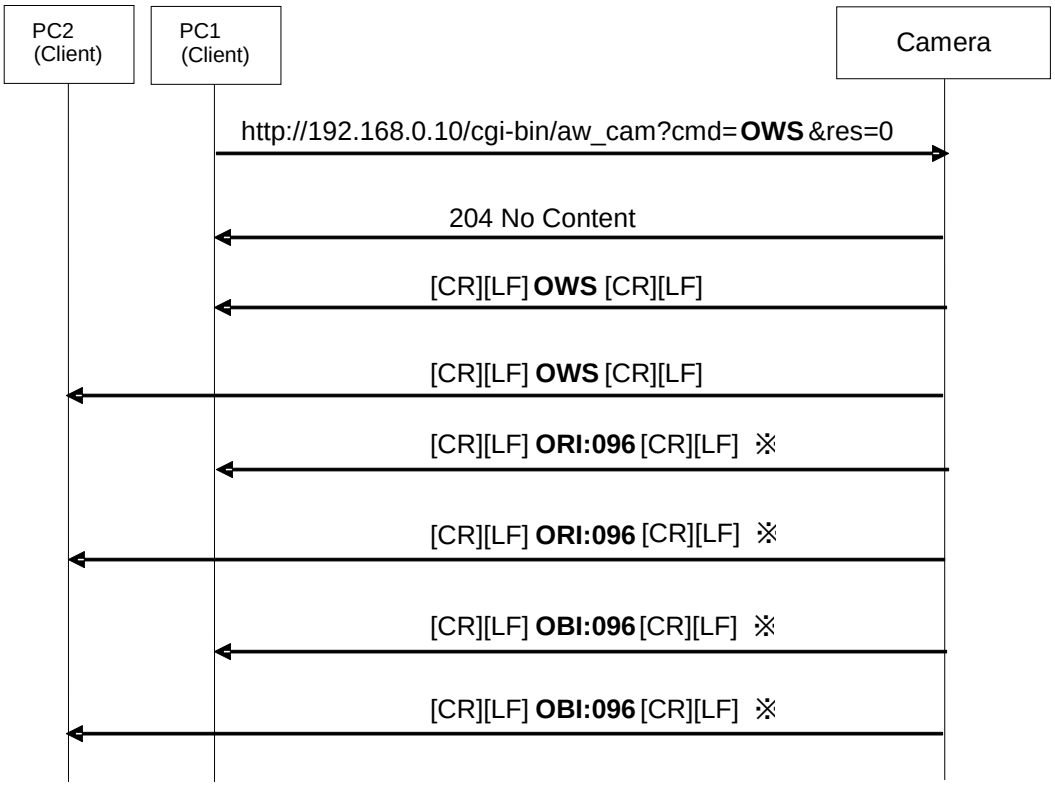
※2: With the AW-HE50 or the AW-HE60, the HTTP response is always given immediately for OAS, and no update notification is sent.

Given below is an example of the sequence which is followed when AWB is executed.

【AWB execution sequence】

As soon as the AWB execution command is received, “204 No Content” is returned as the HTTP response, and as soon as the AWB execution is completed, “OWS” is posted separately as the update notification.

For details on what happens if AWB execution has failed, refer to “6. Error return”.



※ The R gain and B gain update notifications are supported by Ver.2 or a later version for the AW-HE50.

※ In AW-HE50 Ver.2 or subsequent versions or in AW-HE60, if AWB A or AWB B is set as the AWB mode after switching, ORG or OBG is posted instead of ORI or OBI.

Fig.4-12 AWB execution

4.4.6. AWB Mode switching

The contents of the table below are posted in succession by update notifications when the AWB Mode setting has been switched.

Table 4-12

Notification	Remarks	
OAW	AWB Mode	
ORI	R Gain	※Only supported by the AW-HE120/AW-HE130.
OBI	B Gain	※Only supported by the AW-HE120/AW-HE130.

OBG	B Gain	※Notified by AW-HE50 Ver.2 or subsequent versions or by AW-HE60/ AW-HE40/AW-HE65/AW-HE70.

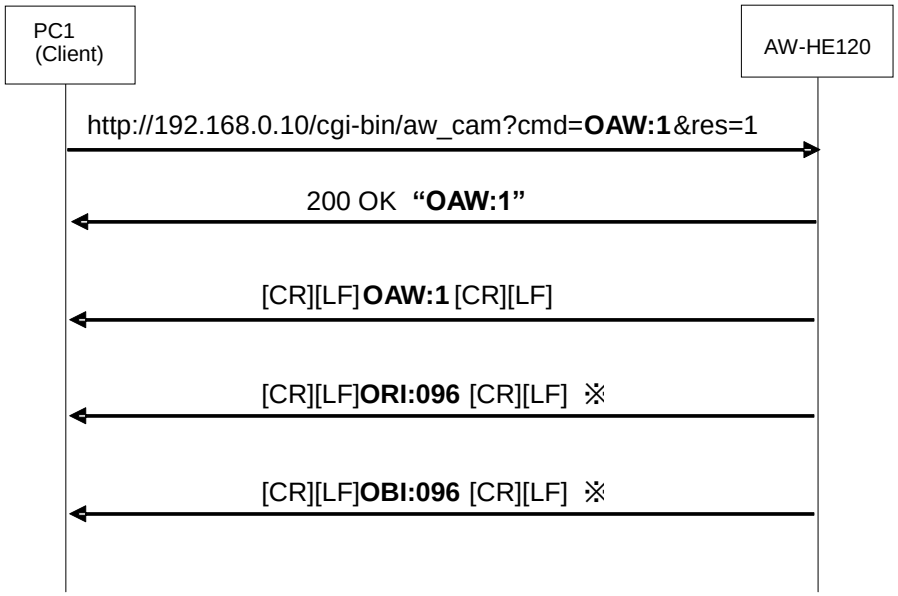
※The R gain and B gain are notified only when the AWB mode after switching has been set to AWB A or AWB B.

The sequence below is followed when the AWB Mode is switched.

【AWB Mode switching sequence】

This sequence is followed if AWB Mode is switched to “AWB A”.

As the response to the AWB Mode switching command, “OAW:1” is returned, and the R gain and B gain settings stored for the AWB Mode after switching are posted in sequence by update notifications.



※ The R gain and B gain update notifications are supported by Ver.2 or a later version for the AW-HE50.

※ In AW-HE50 Ver.2 or subsequent versions or in AW-HE60/AW-HE40/AW-HE65/AW-HE70, if AWB A or AWB B is set as the AWB mode after switching, ORG or OBG is posted instead of ORI or OBI.

5. Camera information batch acquisition

All the information of the camera can be acquired together as a batch.

[Command format]

[Send]

http://**[IP Address]**/live/camdata.html

※**IP Address**…… IP address of camera at connection destination

[Receive]

200 OK "**Camera information"**

※**Camera information** Camera information listed in Table 5-1.
[CR] and [LF] are used as the delimiters of the information.

[Sequence]

The camera information is acquired from PC1. "200 OK [Camera information]" is returned as the response from the camera.

Given below is the command sequence.

6. Error return

The three errors ER1, ER2 and ER3 below are returned in response to control or query commands by the camera.

① ER1 (unsupported command)

This error is generated when a command which is not supported by the camera has been received by the camera.

Example) When the non-existent “XF” command is executed for the camera

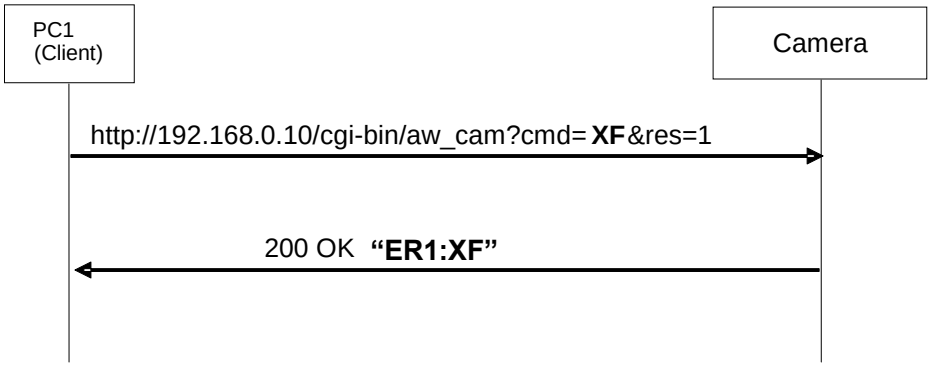

Fig.6-1 Error (ER1)

② ER2 (busy status)

This error is generated during Standby (Power Off) or at other times when the camera is in the busy status.

Example) When the scene file is changed to “Manual1” during Standby.

※In the case of the AW-HE50/AW-HE60

When the scene file is changed to “Scene1” during Standby.

※In the case of the AW-HE120

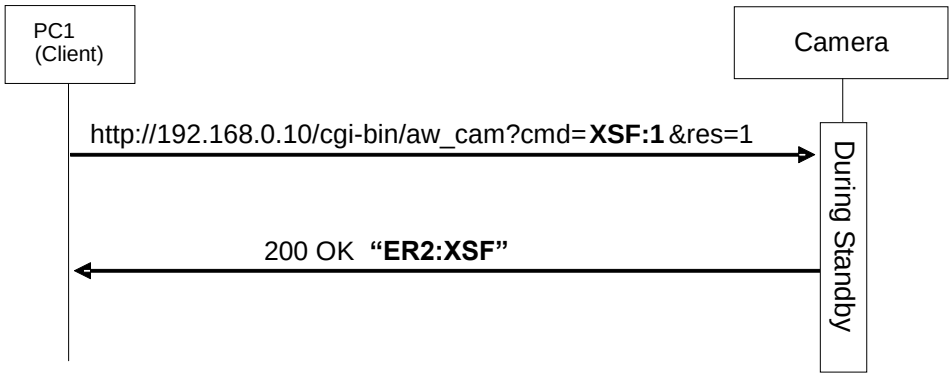

Fig.6-2 Error (ER2)

③ ER3 (outside acceptable range)

This error is generated when the data value of a command is outside the acceptable range.

Example)

The “OGU (gain setting)” command was executed with a data value of “90” which is outside the acceptable range.

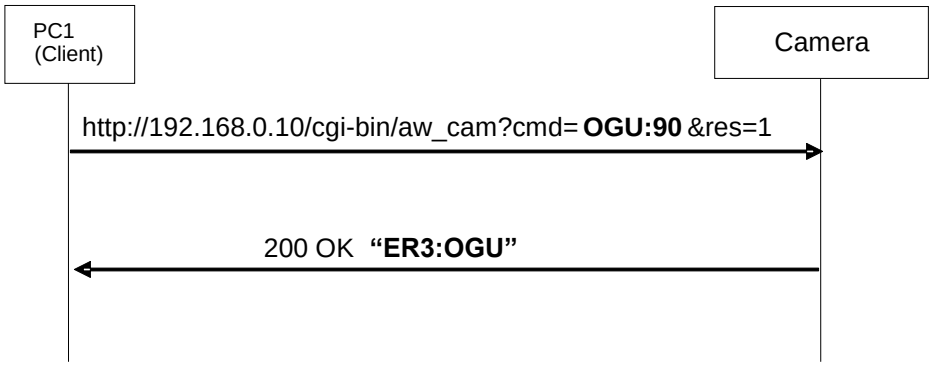

Fig.6-3 Error (ER3)

<Appendix>

This manual describes the HTTP messages using the format for input to the address bar of the web browser as in the example given below.

(Example: http://192.168.0.10/cgi-bin/aw_ptz?cmd=%23PTS5050&res=1)

The actual HTTP messages are in compliance with the HTTP1.1 communication specifications, and have the [Send] and [Receive] formats as given below.

[Send]
A command such as the ones listed below is sent after connection has been made to the specified port (default: 80) which has been set for the camera.

Method: GET

GET /cgi-bin/aw_ptz?cmd=#PTS5050&res=1 HTTP/1.1[CR][LF]	Request
Accept: image/gif, ... (omitted) ... , */*[CR][LF] Referer: http://192.168.0.10/[CR][LF] Accept-Language: en[CR][LF] Accept-Encoding: gzip, deflate[CR][LF] User-Agent: AW-Cam Controller[CR][LF] Host: 192.168.0.10[CR][LF] Connection: Keep-Alive[CR][LF]	Header
[CR][LF]	Blank line

[Receive]
A message with the command name and result value contained in the message body of the HTTP response message is received.
In this manual, this message is given as 200 OK “pTS5050”, but in actual fact commands such as the following ones are received.

HTTP/1.1 200 OK[CR][LF]	Response
